| HTTP 1.1                                                                                                      | HTTP 2.0                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| First version                                                                                                 | New version                                                                                                                                                            |
| It works on the textual format.                                                                               | It works on the binary protocol.                                                                                                                                       |
| There is head of line blocking that blocks all the requests behind it until it doesn't get its all resources. | It allows multiplexing so one TCP connection is required for multiple requests.                                                                                        |
| It uses requests resource Inlining for use getting multiple pages                                             | It uses PUSH frame by server that collects all multiple pages                                                                                                          |
| It compresses data by itself.                                                                                 | It uses HPACK for data compression.                                                                                                                                    |
| Multi TCP connection                                                                                          | Single TCP connection                                                                                                                                                  |
| Not allow                                                                                                     | It allows Server Pushing to add responses proactively into the Browser cache.                                                                                          |
| Some kind of validations missing.                                                                             | Less error-prone than HTTP/1, as HTTP/1 has many "helpers" to deal with whitespace, capitalization, line endings, etc. The more complexity, the more chance of errors. |
| Unsecure                                                                                                      | More secure, as security concerns associated with textual attacks, such as splitting, are no longer relevant.                                                          |
